

Traffic Impact Analysis Preparation Guide

Adopted June 23, 2020
Revised November 14, 2022

Remon Habib, PE
City Engineer

1.0 INTRODUCTION

The City of Lake Elsinore (“City”) requires that the traffic and circulation impacts of proposed development projects, General Plan Amendments, and Specific Plans be analyzed. The traffic impacts of proposed developments are to be analyzed through the preparation of two Traffic Impact Analyses (TIAs) prepared in conformance with City requirements. While CEQA only requires vehicle miles traveled (VMT) analysis for projects, the City is also requiring the use of level of service analysis to determine project impacts on transportation infrastructure. The two Traffic Impact Analyses, as described below, must each be prepared, signed and sealed by a Traffic Engineer or a Civil Engineer registered in the State of California, qualified to practice traffic engineering (“Engineer”). This Traffic Impact Analysis Preparation Guide identifies the required formats and methodologies that are required to be utilized in the preparation of the studies, subject to the review and approval of the City.

2.0 PURPOSE

Two separate Traffic Impact Analysis documents are to be prepared to assess the following:

Report No. 1 (CEQA Analysis)

- **All Projects:** Will the project create an increase in vehicle miles traveled (VMT) versus the existing baseline VMT of the City? If so, what will be required to lower VMT or mitigate these impacts?

Report No. 2 (General Plan Consistency Analysis)

- **Subdivisions, Design Review, Conditional Use Permits, etc.:** Will the Level of Service (LOS) required by the General Plan be maintained at all affected intersections with the addition of traffic from the proposed project? If not, what conditions of approval will be necessary in order to provide the required Level of Service? If conditions of approval or design changes are necessary, are they feasible to implement? Will the project deteriorate traffic operations or safety on and off site?
- **General Plan Amendments and Specific Plans:** Will the ultimate circulation system planned for the area be able to provide the required Level of Service, even with the additional traffic impact of the proposed land use changes? If not, what conditions of approval or project changes will be required in order to provide the required Level of Service?

3.0 TRAFFIC IMPACT ANALYSIS EXEMPTIONS

Certain types of projects, because of their size, nature, or location, may be exempt from the requirement of preparing a TIA. The types of projects that are generally exempt from preparing a TIA are described in Exhibit A.

The City, at its discretion, may require that a TIA be prepared for any development, regardless of size, if there are concerns over safety, operational issues, or if located in an

area heavily impacted by traffic. A focused traffic study may be required by the City to analyze certain aspects of a project.

4.0 COORDINATION WITH CITY/MANDATORY SCOPING AGREEMENT

In order to streamline the TIA preparation and review process, the Engineer shall solicit input and approval for the City prior to the preparation and submittal of a draft document. A “Scoping Agreement for Traffic Impact Study” (Scoping Agreement), attached as Exhibit B, shall be prepared by the Engineer and submitted to the City for review and approval prior to the preparation of a draft TIA. The Scoping Agreement provides for agreement of key points before initiating the TIA including the following:

- Determination of study area, intersections, and roadway links to be analyzed.
- Project trip generation, distribution, and assignment.
- Use of other approved projects for background traffic, traffic growth assumptions, or integration with the traffic Model.
- Analysis scenarios.
- For those projects located near another city, unincorporated County area, and/or Caltrans roadways the Engineer shall also solicit comments on the above from the respective agency staff. The Engineer shall submit all comments from other agencies to the City for review and consideration for the scoping form.

A traffic study scoping agreement shall be filled out and signed by the applicant or applicant’s representative for all development projects regardless of exempt status.

5.0 TRAFFIC IMPACT ANALYSIS – CEQA ANALYSIS

5.1 REQUIRED METHODOLOGY

A key element of SB 743, signed in 2013, is the elimination of automobile delay and LOS as the basis of determining CEQA impacts. For purposes of SB 743 compliance, a VMT analysis shall be conducted for land use projects as deemed necessary by the City and would apply to projects that have the potential to increase the average VMT per service population (e.g. population plus employment) compared to the City’s baseline threshold. Using this metric allows the user to compare the project to the remainder of the City for purposes of identifying transportation impacts.

The following VMT guidelines are based on the WRCOG Implementation Pathway Study, March 2019, which provides options for both methodologies and VMT screening. The methodologies and significance thresholds presented below are based on WRCOG recommendations from the Implementation Pathway Study. The Implementation Pathway Study can be found at <https://www.fehrandpeers.com/wrcog-sb743/>. In addition, a separate

in-depth analysis was prepared to determine specific development sizing that would be considered to have a less-than-significant VMT impact based on a screening threshold of 3,000 MT of CO₂e per year. The analysis was conducting using the RIVCOM model and CalEEMod. This analysis and further details are provided in Exhibit G.

A Project Screening

There are three types of screening that lead agencies can apply to effectively screen projects from project-level assessment. These screening steps are summarized below:

Step 1: Transit Priority Area (TPA) Screening

A TPA is defined as a half-mile area around an existing major transit stop or an existing stop along a high-quality transit corridor. Major transit stops are rail, ferry, or bus terminals served by bus or rail service at the intersection of two or more major bus routes with a service interval frequency of 15 minutes or less during the morning and afternoon peak periods. A high-quality transit corridor is a corridor with fixed route bus service with service interval frequency of 15 minutes or less during the morning and afternoon peak periods.

Projects located within a TPA may be presumed to have a less than significant impact absent substantial evidence to the contrary. This presumption may not be appropriate if the project:

1. Has a Floor Area Ratio (FAR) of less than 0.75;
2. Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking);
3. Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization); or
4. Replaces affordable residential units with a smaller number of moderate- or high-income residential units.

Step 2: Low VMT Area Screening

Residential and office projects located within a low VMT-generating area may be presumed to have a less than significant impact absent substantial evidence to the contrary. In addition, other employment-related and mixed-use land use projects may qualify for the use of screening if the project can reasonably be expected to generate VMT per service population that is similar to the existing land uses in the low VMT area.

For this screening in the WRCOG area, the RIVTAM travel-forecasting model was used to measure VMT performance for individual jurisdictions and for individual traffic analysis zones (TAZs). TAZs are geographic polygons similar to Census block groups used to represent areas of homogenous travel behavior. Total daily VMT per service population (population plus employment) was estimated for each TAZ. This

presumption may not be appropriate if the project land uses would alter the existing built environment in such a way as to increase the rate or length of vehicle trips.

To identify if the project is in a low VMT-generating area, the analyst may review the WRCOG screening tool and apply the appropriate threshold within the tool. Additionally, as noted above, the analyst must identify if the project is consistent with the existing land use within that TAZ and use professional judgement that there is nothing unique about the project that would otherwise be misrepresented utilizing the data from the travel demand model.

The WRCOG screening tool can be accessed at the following location:

<https://apps.fehrandpeers.com/WRCOGVMT/>

Step 3: Project Type Screening

Local serving retail projects less than 50,000 square feet may be presumed to have a less than significant impact absent substantial evidence to the contrary. Local serving retail generally improves the convenience of shopping close to home and has the effect of reducing vehicle travel.

In addition to local serving retail, the following uses can also be presumed to have a less than significant impact absent substantial evidence to the contrary as their uses are local serving in nature:

- Local-serving K-12 schools
- Local parks
- Day care centers
- Local-serving gas stations
- Local-serving banks
- Local-serving hotels (e.g. non-destination hotels)
- Student housing projects
- Police, fire, and emergency services facilities
- Government offices (e.g. City facilities, libraries, local community centers)
- Local serving community colleges that are consistent with the assumptions noted in the RTP/SCS
- Projects generating less than 110 daily vehicle trips per California OPR VMT Guidance, the latest edition of the ITE Trip Generation Manual, or acceptable trip generation methodology.

In addition to the above uses, the following uses and project sizes would also be presumed to have a less than significant impact based on the analysis provided in Exhibit G:

- Single Family Residential – 148 Dwelling Units
- Multi Family Low Rise Residential (Up to 2 levels) – 200 Dwelling Units

- Multi Family Mid Rise Residential (between three and 10 levels) – 266 Dwelling Units
- General Office Building – 224,000 square feet
- Retail – 91,000 square feet
- Warehousing (Unrefrigerated) – 258,000 square feet
- Light Industrial – 149,000 square feet
- Project GHG emissions less than 3,000 Metric Tons of Carbon Dioxide Equivalent (CO₂e) as determined by a methodology acceptable to the City. Use of project-specific trip lengths from RIVCOM and resulting GHG data from CalEEMod runs are acceptable.

B. VMT Assessment for Non-Screened Development

Projects not screened through the steps above should complete VMT analysis and forecasting through the latest version of the RIVCOM model to determine if they have a significant VMT impact. This analysis should include 'project generated VMT' and 'project effect on VMT' estimates for the project TAZ (or TAZs) under the following scenarios:

- Baseline conditions - This data is already available in the web-screening map.
- Baseline plus project for the project - The project land use would be added to the project TAZ or a separate TAZ would be created to contain the project land uses. A full base year model run would be performed and VMT changes would be isolated for the project TAZ and across the full model network. The model output must include reasonableness checks of the production and attraction balancing to ensure the project effect is accurately captured. If this scenario results in a less-than-significant impact, then additional cumulative scenario analysis may not be required (more information about this outcome can be found in the Thresholds Evaluation discussion later in this chapter).
- Cumulative no project - This data is available from WRCOG.
- Cumulative plus project - The project land use would either be added to the project TAZ or a separate TAZ would be created to contain the project land uses. The addition of project land uses should be accompanied by a reallocation of a similar amount of land use from other TAZs; especially if the proposed project is significant in size such that it would change other future developments. Land use projects will generally not change the cumulative no project control totals for population and employment growth. Instead, they will influence the land use supply through changes in general plan land use designations and zoning. If project land uses are simply added to the cumulative no project scenario, then the analysis should reflect this limitation in the methodology and acknowledge that the analysis may overestimate the project's effect on VMT.

The model output should include total VMT, which includes all vehicle trips and trip purposes, and VMT per service population (population plus employment). Total VMT (by speed bin) is needed as an input for air quality, greenhouse gas (GHG), and energy impact analysis while total VMT per service population is recommended for transportation impact analysis.

Both “plus project” scenarios noted above will summarize two types of VMT: (1) project generated VMT per service population and comparing it back to the appropriate benchmark noted in the thresholds of significance, and (2) the project effect on VMT, comparing how the project changes VMT on the network looking at Citywide VMT per service population and comparing it to the no project condition.

Project-generated VMT shall be extracted from the travel demand-forecasting model using the origin-destination trip matrix and shall multiply that matrix by the final assignment skims. The project-effect on VMT shall be estimated using the City limit and extracting the total link-level VMT for both the no project and with project condition.

A detailed description of this process is attached to these guidelines in Exhibit F.

C. VMT Impact Thresholds

A project would result in a significant project-generated VMT impact if either of the following conditions are satisfied:

1. The baseline project-generated VMT per service population exceeds the City’s baseline VMT per service population, or
2. The cumulative project-generated VMT per service population exceeds the City’s baseline VMT per service population.

The project’s effect on VMT would be considered significant if it resulted in either of the following conditions to be satisfied:

1. The baseline link-level boundary VMT per service population (City boundary) to increase under the plus project condition compared to the no project condition, or
2. The cumulative link-level boundary VMT per service population (City boundary) to increase under the plus project condition compared to the no project condition.

Please note that the cumulative no project shall reflect the adopted Regional Transportation Plan/Sustainable Communities Strategy; as such, if a project is consistent with the regional RTP/SCS, then the cumulative impacts shall be considered less than significant subject to consideration of other substantial evidence.

Potential impacts to public transit, pedestrian facilities and travel, and bicycle facilities and travel can be evaluated using the following criteria:

- A significant impact occurs if the project conflicts with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decreases the performance or safety of such facilities.

Therefore, the TIA should include analysis of a project to examine if it is inconsistent with adopted policies, plans, or programs regarding active transportation or public transit facilities, or otherwise decreases the performance or safety of such facilities and make a determination as to whether it has the potential to conflict with existing or proposed facilities supporting these travel modes.

D. VTM Mitigation Measures

To mitigate VMT impacts, the following choices are available to the applicant:

1. Modify the project's built environment characteristics to reduce VMT generated by the project
2. Implement transportation Demand Management (TDM) measures to reduce VMT generated by the project.
3. Participate in a VMT fee program and/or VMT mitigation exchange/banking program (if they exist) to reduce VMT from the project or other land uses to achieve acceptable levels

As part of the WRCOG Implementation Pathway Study, key TDM measures that are appropriate to the region were identified and can be accessed at the following location:

<https://www.fehrandpeers.com/wp-content/uploads/2019/03/TDM-Strategies-Evaluation.pdf>

Measures appropriate for most of the WRCOG region are summarized in Attachment B of the TDM Strategies Evaluation Memorandum. Evaluation of VMT reductions should be evaluated using state-of-the-practice methodologies recognizing that many of the TDM strategies are dependent on building tenant performance over time. As such, actual VMT reduction cannot be reliably predicted and monitoring may be necessary to gauge performance related to mitigation expectations.

The California Environmental Quality Act (CEQA) allows the City Council to approve development projects even in instances where the VMT thresholds are exceeded, if the project has overriding benefits. Examples include projects that provide jobs in a local area, projects that provide needed transportation improvements that otherwise would not be constructed, projects that provide habitat conservations, projects that implement non-motorized transportation systems, or projects that provide some unique benefits to the City, which outweigh the traffic impacts. These projects are required to mitigate traffic impacts to the extent that it is economically feasible as determined by the City Council, based on a value engineering analysis.

Projects that may have a significant traffic impact and require a finding of overriding considerations will be required to prepare an Environmental Impact Report (EIR). The need to prepare an EIR shall be determined through consultation between the City's Engineering and Planning Departments, and the City Attorney.

5.2 TRAFFIC IMPACT ANALYSIS FORMAT – CEQA ANALYSIS

The traffic impact analysis report for CEQA should generally have the following items:

1. Project and Analysis Introduction
 - a. Purpose
 - b. Study Objectives
 - c. Project Location and Description
 - d. Project Consistency with General Plan
2. Methodology
 - a. City and Regional Guidelines and Requirements
 - b. Screening Results
 - c. RivCOM Description
 - d. City Baseline and Cumulative Conditions
3. Results
 - a. Baseline Plus Project Conditions
 - b. Cumulative Plus Project Conditions
 - c. Comparison Between Conditions to Determine Impacts
4. Mitigations, if any
5. Conclusion

6.0 GENERAL PLAN CONSISTENCY ANALYSIS

6.1 REQUIRED METHODOLOGY

A Intersection Analysis

The City requires the use of the Transportation Research Board - Highway Capacity Manual 6 (HCM6) or most recent release. Unsignalized and signalized intersections are to be analyzed using Highway Capacity Manual. Refer to Exhibit C for default input parameters for software analysis. For default values not specifically provided in Exhibit C, the Engineer shall refer to the HCM6 or most recent release.

The City accepts all microsimulation software for intersection analysis as long as they conform to HCM6 (or later) analysis methodologies.

The City of Lake Elsinore, in general, requires that peak-hour intersections operate at LOS “D” or better to be considered acceptable. Therefore, any City intersection operating at LOS “E” or LOS “F” will be considered deficient. However, LOS “E” will be considered acceptable in both the Main Street Overlay area and the Ballpark District Planning Districts in an effort to increase activity and revitalize these areas. Any intersection operating at LOS “F” will be considered deficient.

Software analysis using existing traffic signal timing is not required for study intersections with the exception of Railroad Canyon Road-Diamond Drive between Lakeshore Drive-Mission Trail and Grape Street-Summerhill Drive, and Central Avenue between Dexter Avenue and Riverside Street. Caltrans or other agencies may require the use of existing

signal timing for analysis on Caltrans facilities. Existing signal timing documentation for City intersections is available upon request.

B. Roadway Segment ADT Analysis

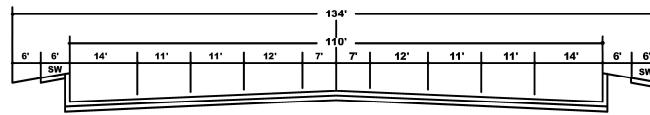

The City may require that analysis of Average Daily Traffic (ADT) on roadway segments be conducted in certain cases, such as when intersection analyses are not the controlling factor or for planning purposes or when the project requires analysis of buildout conditions. Level of service for roadway segments shall be analyzed by calculating daily vehicle-to-capacity ratios. Peak hour through traffic to lane capacity ratios are not acceptable. Roadway capacities shall be per Table 1, Daily Traffic Volume Capacity Values. Roadways that are not at the ultimate condition as shown in Table 1 are to use the roadway capacities per City of Lake Elsinore General Plan Figure 2.2.

Roadway segment LOS criteria shall be per Table 2, Daily Level of Service Criteria. Roadway segments operating at “Potentially Exceeds Capacity” levels may be acceptable if adjacent intersections are operating acceptably in the peak hour. Roadway segments operating at “Deficient” levels shall be improved with additional through lanes along the segment.

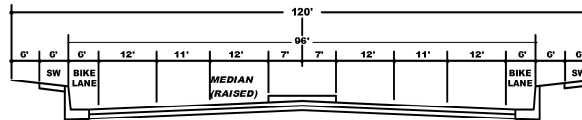

Table 1, Daily Traffic Volume Capacity Values

ROADWAY CLASSIFICATION	NUMBER OF LANES	MAXIMUM TWO-WAY TRAFFIC VOLUME (ADT)
		SERVICE LEVEL E
Collector	2	13,000
Divided Collector	2	18,000
Secondary	4	25,900
Major	4	34,100
Urban Arterial	6	53,900
Urban Arterial	8	71,800
NOTES		
1. All capacity figures are based on optimum conditions and are intended as guidelines for planning purposes only.		
2. Maximum two-way ADT values are based on the 1999 Modified Highway Capacity Manual Level of Service Tables as defined in the Riverside County Congestion Management Program. Divided Collector interpolated.		
3. Two-lane roadways designated as future arterials that conform to arterial design standards for vertical and horizontal alignment are analyzed as arterials.		
4. Ramp capacity is given as a one-way traffic volume.

Table 2, Daily Level of Service Criteria

LEVEL OF SERVICE	DAILY LEVEL OF SERVICE CRITERIA	
	INDICATES	V/C RATIO RANGE
A	Acceptable	0 to 0.80
AC	Approaching Capacity	0.81 to 1.00
PEC	Potentially Exceeds Capacity	1.01 to 1.24
D	Deficient	>1.24

C. Freeway Analysis

The City and/or Caltrans may require that freeway operation be analyzed if a project is within one mile of a state highway or if it impacts freeway facilities experiencing unstable traffic flow or congestion. Determination may be made during the scoping process or once a deficiency is identified in the analysis process. Caltrans should be consulted during the scoping phase to determine freeway analysis requirements. Freeway facility analysis shall be done per HCM6 methodologies.

D. Queuing, Coordination, Truck Turning, and Other Analysis

The City and/or other agencies may require additional specific traffic analysis to be completed in the traffic study to determine a project's traffic affects and any requirements that need to be implemented to determine General Plan consistency. Specific analysis to be required can be provided by agencies during the scoping process or during the review of the project's traffic study submittals.

E. Area to be Studied

In general, the minimum area to be studied shall include any intersection of "Collector" or higher classification street, with other "Collector" or higher classification streets, at which the proposed project will add 50 or more peak hour trips, not exceeding a 5-mile radius from the project site. In addition, project driveways and other nearby intersections may be included as required by the City. Roadway segments, if required to be analyzed, shall include all roadway segments with 500 or more daily project trips. The City or other agencies may require deviation from these requirements based on area conditions.

F. Analysis Scenarios

1. Subdivisions, Design Review, Conditional Use Permit Cases, etc.

The TIA shall include the following analysis scenarios:

- a. Existing Traffic.** Existing traffic will be counted to determine current conditions. Traffic count data shall be new or recent. Data up to one year old may be acceptable with the approval of the City. Any exception to this must be requested

and granted prior to approval of the scoping agreement. Traffic counts shall be done during standard weekdays (Tuesdays or Thursdays) when school is in session and/or weekends as required depending on the type of project. Care shall be taken when scheduling traffic counts as school bell schedules and calendars may vary between schools and neighboring school districts. The existing peak hour factor (PHF) for each intersection from the counts shall be used in the analysis.

- b. Project Completion (existing + ambient + project).** Traffic generated by the proposed project will be calculated then added to Project Opening Year (existing + ambient) volumes to establish Project Completion conditions, and the impacts on the circulation system will be analyzed. The existing peak hour factor (PHF) for each intersection from the counts shall be used in the analysis. This will be the basis for determining project-specific impacts, and conditions of approval.
- c. Cumulative (existing + ambient + project + cumulative).** Traffic generated by other approved projects in the study area shall be identified and added to the Project Completion traffic identified in Scenario 3. This may also include projects that are proposed and in the review process, but not yet fully approved. A reasonable absorption rate up to 100% for cumulative project trip generation can be assumed. The peak hour factor (PHF) for each intersection may be up to 0.95 for analysis. This scenario will be analyzed, and a determination made if improvements funded through the TUMF or other approved funding mechanism (DIF, Road and Bridge Benefit District, etc.) can accommodate the cumulative traffic at the target Level of Service (LOS) identified in the General Plan. If the “funded” improvements can provide the target LOS, payment into the TUMF (or other fee structure) may be considered as cumulative measures that are required through the conditions of approval. Other improvements needed beyond the “funded” improvements (such as localized improvements to non-TUMF facilities) should be identified as such and a fair share percentage shall be provided in the report.
- d. Project Phasing.** Traffic conditions at each project phase completion are to be analyzed using the same approach as for the project completion year, if applicable. Traffic associated with each previous project phase shall be included in the analyses of each successive phase of the proposed project. This generally applies to large projects with development construction/occupancy spanning multiple years. Generally, phases are spaced two or more years apart. If no phasing analysis is provided, the project will be conditioned as if all project components are built at one time.

2. Land Use or Circulation General Plan Amendments or Specific Plans

Development proposals that also include a General Plan Amendment, Specific Plan, Zone Change or other approval that increases traffic beyond what was approved in the General Plan will also be required to perform a Build-out Analysis to assess long-term impacts. This analysis will determine if the Circulation Element of the General Plan is adequate to accommodate projected traffic at the target LOS, or if additional conditions of approval are necessary. The build-out year shall match the latest general plan. Roadway segments and

intersections can be assumed to be built to General Plan requirements for the analysis. A phasing plan for all Specific Plans that identifies the improvement requirements for each development phase is required.

G. Future Traffic Forecasts

1. Background Traffic for Subdivisions, Design Review, Conditional Use Permit Cases and Project Phasing

All projects within the study area that have received approvals for development (approved design reviews, approved tentative tracts, approved conditional use permits, etc.) shall be identified, and their traffic generation included as cumulative traffic in the study. Proposed projects in the study area that have been submitted to the City for processing, but not yet approved, may also be included at the discretion of the City. The City will also specify an ambient growth rate to be applied to existing volumes to account for other general traffic growth in and around the study area. In general, the ambient growth rate is 2% per year.

The traffic from other approved or known projects shall be added to the existing traffic plus the ambient growth rate plus the proposed project to determine future projected traffic at “Opening Year” of the project, or any subsequent phase (analysis scenario 4 above).

2. Build-Out Studies for General Plan Amendments and Specific Plans

Traffic projections for Build-out scenarios shall utilize the City of Lake Elsinore’s traffic model. The Engineer shall use the model projections as the basis for determining the base average daily traffic volumes for segments and turning-movement volumes for the required intersection analysis. A manual assignment of the project traffic added to the Build-out traffic may typically be used to determine total future traffic, as approved by the City.

Certain large-scale Specific Plans and General Plan Amendments have the potential to create traffic impacts that are substantially greater than the traffic projections forecasted in the City Traffic Model. For these projects, the City may request that the Build-out analysis utilize and run the City Traffic Model to develop more detailed focused model runs in order to determine the projected Build-out traffic. The following are guidelines of projects will be subject to the revised modeling requirements:

- 1,500 dwelling units or greater
- 25 acres of commercial or greater
- 150 acres of industrial or greater
- any project producing 15,000 daily trips or greater

6.2 TRAFFIC IMPACT ANALYSIS FORMAT - GENERAL PLAN CONSISTENCY

The format and required elements to be included in the TIA are specified in Exhibit D. Deviations from this format require the approval of the City. The TIA will generally include the following major components, as shown in more detail in Exhibit D and described herein:

- Level of Service analysis

- Proposed conditions of approval
- Traffic signal warrant analysis
- On-site circulation analysis
- Identification of safety and operational improvements

In addition to the above, General Plan Amendments and Specific Plans shall include the following:

- Specific Plan signalization analysis
- General Plan conformance review
- Caltrans conformance review
- Identification of regional funding mechanisms

Projects that involve special uses, such as truck-intensive projects or special events, may also be required to perform additional analysis to determine project impacts.

The City can require additional analysis beyond the above major components to be added to the scoping form. Additional analysis can also be brought up in a City comment after review of a traffic study draft.

A. Level of Service Analysis

The City of Lake Elsinore General Plan identifies an established minimum Level of Service standard. These minimums may vary according to the area of the City involved. The Traffic Impact Analysis shall address whether or not the required Levels of Service will be achieved after the proposed project is constructed. Level of Service calculations shall be included with the TIA for all intersections and segments studied. For intersections or roadway links not meeting the required Level of Service, the intersection or roadway link's Level of Service must be recalculated using the proposed conditions of approval to verify that the required Level of Service will be achieved. For sites with heavy truck usage, Passenger Car Equivalents (PCE's) as approved by the City shall be utilized in the analysis. The City of Fontana's Truck Trip Generation Study and/or the ITE High Cube Warehouse Vehicle Trip Generation Analysis may be used for truck split rates and other data as approved by the City.

The City's Level of Service standards, as published in the City's General Plan are included in the attached Exhibit E.

B. Proposed Conditions of Approval

All studies that propose increasing the number of travel lanes on a road or intersection, either beyond existing conditions or for General Plan conditions beyond what is planned for that level of roadway shall clearly identify the impacts associated with such a change. Identification of funding mechanisms available to fund the improvements and exhibits showing the lane configuration must be provided in the report.

The exhibits illustrating the improvements must be to scale but conceptual in nature (not engineering drawings). The concept illustrations must depict, in addition to existing and required right-of-way, any physical barriers that might preclude making the needed improvements. Barriers that may preclude making the improvements, such barriers as

railroads, major drainage structures, power lines, and others must be identified. Any other features that might render the improvements infeasible must also be identified. The objective is to ensure that when Conditions of Approval are written, there will be every expectation that the required improvements can, in fact, be made.

Concept illustrations, as described above, shall be prepared for the following instances:

- All improvements, whether on-site or off-site, necessary to reduce identified traffic levels that exceed General Plan requirements under Existing plus Ambient Growth plus Project conditions;
- All improvements abutting the proposed project and that are necessary to reduce identified traffic levels that exceed General Plan requirements under Existing plus Ambient Growth plus Cumulative Projects plus Project conditions;
- All improvements where the required improvements exceed the number of lanes, under any traffic scenario, that would typically be developed at full implementation of roadways per the General Plan and the standards for the applicable roadway classification.

In all cases, the feasibility of the proposed improvements must be demonstrated and the availability of right-of-way must be ascertained. Acquisition of additional right-of-way, if necessary, is the responsibility of the project proponent. If additional right-of-way must be acquired, either adjacent to the project or off-site, the project proponent must follow the following procedures:

- When alternate access is required and the alternate access is off-site, or when any other public improvement is required or proposed off-site, the land divider shall do each of the following as part of the tentative map review:
 - a. Provide any studies or information required to adequately evaluate the environmental impacts of constructing the off-site improvement/alignment; and,
 - b. Show all proposed centerline, approximate gradients and radii on the tentative map in addition to other factors such as street widths, pavement surface, etc. for the off-site improvement/alignment; and,
 - c. Provide mailing labels showing the addresses of property owners that are adjacent to the off-site improvement/alignment for hearing notification purposes; and,
 - d. Provide written assurance(s) from the owner(s) of the property underlying the offsite improvement/alignment that sufficient right-of way to construct will be provided. A formal agreement or offer of dedication is not necessary to satisfy this requirement, but the owner's willingness to cooperate must be communicated in a form acceptable to the Engineering Department.

In the event that the land divider does not satisfy one or more of the requirements set forth in the above paragraphs a., b., or c., and no exception is granted, the tentative map shall be redesigned such that

the off-site improvement/alignment is no longer required. If the land divider refuses or is unable to redesign, project review staff shall recommend to the appropriate hearing body that the tentative map be denied. In the event that the land divider does not satisfy the requirement set forth in this paragraph, project review staff shall note in its report the potential need to institute eminent domain proceedings and the appropriate Advisory Agency or Appeal Board may, in its discretion, act on the tentative map as designed or require that the map be redesigned to eliminate the off-site improvement/ alignment.

C. Traffic Signal Warrant Analysis

The Engineer shall review all unsignalized intersections within the study area, including the project access points, to determine if signal warrants are met for any of the study year scenarios (existing, opening year with and without project, cumulative, etc.) The signal warrant analysis shall utilize the Caltrans peak-hour warrants (Warrant 3). The warrant analysis worksheets shall be included in the study appendices. Warrant outputs from traffic analysis software programs are acceptable.

D. On-site Circulation and Parking

The TIA shall examine the proposed on-site circulation for the project and address its adequacy. This includes identifying the desired level of traffic control and adequate vehicle storage space at project driveways and/or intersections. Queueing analysis at project driveways or study intersections may be required on the scoping agreement or after review of a traffic study draft.

On-site parking availability shall be analyzed for all residential, commercial, and industrial projects unless otherwise agreed upon by the City. Available parking shall be per the City's Municipal Code. Shortages in required parking can be addressed by providing active transportation facilities, shared-ride pickup/drop-off areas, and/or be near a transit stop as approved by the City. Working with the City's planning department prior to beginning of the traffic study to work out parking requirements is highly recommended.

E Safety and Operational Analysis

The TIA shall examine existing roadway conditions to determine if safety and/or operational improvements are necessary due to increase in traffic from the project or cumulative projects. The types of improvements to be identified may include, but are not limited to, the following:

- Need for separate turning lanes
- Intersections needing future sight distance studies
- Realignment of roadway segments or intersections
- Parking restrictions
- Measures to reduce cut-through project traffic in adjacent residential areas
- Potential impacts to adjacent schools and businesses
- Queue lengths and impacts to adjacent intersections
- Need for signal interconnect systems

- Traffic calming measures in residential, school, or commercial areas

F. General Plan Conformance

The TIA shall identify if the roadway system proposed in the Circulation Element of the General Plan is adequate to accommodate traffic from the project, or if changes to the General Plan are proposed as part of the project approval.

G. Regional Funding Mechanisms

Identify if the project identified in a City fee program, or is located within an existing Road and Bridge Benefit District (RBBD), Assessment District, Western Riverside Council of Governments' Transportation Uniform Mitigation Fee (TUMF), or identified in another regional funding mechanism.

H. Fair Share Contributions

Cumulative deficiencies for intersections or roadway segment should include a fair-share contribution toward achieving acceptable levels of service. If a cumulatively-deficient location is included in an existing traffic impact fee program (such as TUMF), payment of those fees would constitute an appropriate contribution.

Fair share contribution percentage for improvements where the project is not directly responsible should be calculated by the following formula:

$$\text{Fair share percentage} = \frac{\text{project trips}}{\text{project trips} + \text{future development trips}}$$

The project will be responsible for the highest fair share percentage of the peak hours at each facility. For example, if a project results in an AM peak hour fair share of 15% and a PM peak hour fair share of 20%, the project will be responsible for the 20% fair share.

I. Special Uses

- **Truck Intensive Uses (Conditional Use Permits, Surface Mining Permits, etc.)**

In addition to the standard TIA requirements, or if the standard TIA requirements are waived, projects that are "truck intensive" (warehouses, surface mining permits, etc.,) may be required to submit a study addressing the truck access routes, adequacy of the existing streets to be used (in terms of geometry and structural section), safety issues relating to the truck traffic, and the impacts of the truck traffic on existing residences or businesses.

The City may accept trip generation rates and/or truck trip splits from the Fontana Truck Trip Generation Study, 2003, and/or the ITE High Cube Warehouse Vehicle Trip Generation Analysis, 2016, for truck intensive projects. PCE rates may also be required for all truck intensive projects. PCE rates are as follows:

- Large 2-axle vehicles – 1.5
- 3-axle trucks – 2.0

- 4+axle trucks – 3.0

- **Unique Land Uses and Special Event Uses**

Unique land uses that do not exhibit typical trip generation characteristics may require additional analysis. Examples of such uses would be land uses not in the ITE Trip Generation Manual. Traffic counts at three similar locations in southern California may be required to determine trip generation rates.

Special event land uses that do not exhibit typical trip generation characteristics may require additional analysis, including weekend and off-peak scenarios. Examples of such uses would be sports stadiums, racetracks, weekend events, or uses that exhibit substantial traffic peaking associated with special events that are scheduled on a periodic basis. Traffic counts at three similar locations in southern California may be required to determine trip generation rates and traffic characteristics. The traffic analysis for periodic uses shall include a traffic management plan to control traffic impacts associated with the special events as needed. Adequate circulation shall be provided to the site and all impacts shall be alleviated to the maximum extent possible.

The following types of traffic effects are considered exceed General Plan standards:

- 1) When existing traffic conditions (Analysis Scenario 1) exceed the General Plan target LOS.
- 2) When project traffic, when added to existing traffic (Analysis Scenario 2 and 3), will deteriorate the LOS to below the target LOS and impacts cannot be reduced to meet General Plan requirements through project conditions of approval.
- 3) When cumulative traffic (Analysis Scenario 4) exceeds the target LOS, and impacts cannot be reduced through the TUMF network (or other funding mechanism), project conditions of approval, or other implementation mechanisms.

7.0 SUBMITTAL REQUIREMENTS AND PROCEDURE

A scoping agreement for traffic impact study form must be submitted for approval prior to preparation of the traffic study. The scoping agreement form shall be completed and submitted along with the required initial fee to be estimated by the City, depending on the complexity of the project.

- (a) The project scoping form must indicate whether or not the project is part of a Specific Plan (SP) and, if part of an SP, must provide a listing of other approved and active projects within the SP, and whether or not an SP amendment is proposed.
- (b) The scoping form must also show the land use designation per the City General Plan and the proposed land use designation. The scoping form provides space to show this information.

- (c) The scoping agreement must include the following information in addition to or as elaboration of the information on the scoping form:
- A description of the intended land uses and quantities
 - A legible site plan showing:
 - i. Existing and proposed driveway locations on site;
 - ii. Existing and proposed driveways on adjacent properties;
 - iii. Existing and proposed driveways on the opposite side of the street frontage, extended 300 feet on either side of the project extremities;
 - iv. Access control for proposed driveways (full access, right in-right-out, left-in, etc.).
 - A figure showing study intersections and roadways.
 - A figure showing expected trip distribution for the project. Projects with substantial truck trips or other unique factors may require separate distributions for each type of vehicle or land use.
- (d) An estimate of the trip generation for the project based on ITE Trip Generation Manual rates or other approved source.
- (e) The expected trip distribution for the project. This may be left blank in favor of distribution figures.
- (f) The list of roadway segments to be analyzed, if needed.
- (g) The list of intersections to be analyzed.
- (h) Any other information in support of the scoping form.
- a) Upon approval of the scoping agreement and completion of the traffic study report, submit the Traffic Impact Study report directly to the City planner responsible for the project. Submittals shall be electronic in pdf form and Microsoft Word format upon request. The City may request hard copies of the report if needed. Clearly identify the project case number on the cover of the report. The approved scoping agreement and cumulative projects list as provided by the City shall be included in the appendix of the traffic impact study.
- b) If revisions to the Traffic Impact Study are necessary, re-submit complete electronic copies along with a copy of the comments provided by the City.
- c) Traffic Impact Studies must be submitted to the City within six months after the Scoping Agreement is signed by the Department. If not, the Scoping Agreement may be considered void, and a new one may be required.

Traffic Impact Analysis Preparation Guide

EXHIBIT A

TRAFFIC IMPACT ANALYSIS EXEMPTIONS

The following types of development proposals are generally exempt from Traffic Impact Analysis requirements:

1. Design Review and Conditional Use Permit Cases for projects of one acre or less.
2. Preschools, Elementary Schools and Middle Schools.
3. Churches, Lodges, Community Centers, Neighborhood Parks and Community Parks.
4. Any use which can demonstrate, based on the most recent edition of the Trip Generation Manual published by the Institute of Transportation Engineers (ITE) or other approved trip generation data, trip generation of less than 50 vehicle trips during the AM or PM peak hour.

These exemptions will apply **in most cases**; however, the City reserves the right to require a full traffic impact analysis or a focused traffic impact analysis for any development regardless of size and/or type. The level of analysis shall be determined on an individual basis. The following are some examples of conditions under which an exemption would not be granted.

- a. The presence of an existing or potential safety problem.
- b. The location of the development in an environmentally or otherwise sensitive area, or in an area that is likely to generate public controversy.
- c. The presence of a nearby substandard intersection or roadway segment. This is normally considered to be an existing Level of Service "D" or worse or substandard improvements.
- d. The need for a focused study for access/operational issues.
- e. A request from an affected agency, such as Caltrans or an adjacent city, which is deemed by the City to be reasonable and rational.

SIGNALIZED INTERSECTION ANALYSIS INPUT PARAMETERS

<u>PARAMETER</u>	<u>VALUE</u>
Base Saturation Flow Rate	1900 passenger cars/hr/ln
Heavy Vehicle factor	Determine % heavy vehicle in existing traffic stream based on count data or consultation with City. Generally, 2% heavy vehicle percentage is acceptable. Projects with truck intensive uses must convert project trips to passenger car equivalents (PCE). Truck intensive uses include heavy industrial, warehousing or as determined by the City. Projects near truck intensive areas may be required to use PCE for existing volumes.
Grade	Include as appropriate
Exclusive left turn lane	peak hour volume > 100
Dual left turn lanes	peak hour volume > 300
Protected Left Turn Phasing	Left turn volume > 240 vph
Minimum green time	7 seconds each movement in areas of light pedestrian activity. In areas of heavy pedestrian activity, the minimum green shall be calculated based on the methodology in the HCM.
Pedestrian FDW Time	Crosswalk length (bottom of ramp to bottom of ramp) divided by 3.5 feet per second.
Cycle length	60 sec to 120 sec unless otherwise approved by the agency
Platoon Ratio	1.00 unless otherwise approved by the City
Lost time	Per HCM Exhibit 10-17 (below)

Major street	Minor Street	Number of Phases	L (s)
Protected	Protected	4	16
Protected	Permitted	3	12
Permitted	Protected	3	12
Permitted	Permitted	2	8

*Any deviation from these parameters requires prior approval from City of Lake Elsinore. Refer to HCM6 for any default values not specifically identified here.

Intersection analyses should be conducted utilizing acceptable software based on HCM6 methodology. Closely spaced intersections are to be analyzed using analysis tools capable of accounting for turn lane storage, queue length, blockage, etc. such as Synchro. In cases where traffic is added from a sizable number of cumulative projects, the consultant shall use their engineering judgment in the application of peak hour factors to maintain consistency with the existing conditions analyses. A peak hour factor of 0.95 shall be applied to project buildout traffic conditions.

Exhibit D

Traffic Impact Analysis – General Plan Consistency Format

The Traffic Impact Analysis shall generally include the following items, unless waived by the City.

I. Introduction

- A. Purpose of the TIA and Study Objectives
- B. Site location and study area exhibit
- C. Development project identification - City Project Number and related case numbers, i.e. S.P.A. amendment number, E.I.R. number, etc.
- D. Development project description
 - 1) Project size and description
 - 2) Existing land use and zoning
 - 3) Proposed land use and zoning
 - 4) Site plan of proposed project (reduced)
 - 5) Proposed project opening year
 - 6) Any proposed project phasing
 - 7) Indicate if project is within another agency's boundaries

II. Area Conditions

- A. Identify Study Area and Intersections
- B. Existing traffic controls and intersection geometrics exhibit
- C. Descriptions of existing roads (number of lanes, classification, bicycle facilities, sidewalks, parking, etc.)
- D. Existing traffic volumes - AM and PM peak hour turning movements and daily roadway links, if required

- E. Existing delay and Level of Service at study intersections/roadway links
- F. Provide copy of the City's General Plan Circulation Element figure and cross sections figure
- F. Indicate if Transit service is available in the area and along which routes

III. Projected Future Traffic

A. Project Traffic and Project Phasing (each study year)

1. Ambient growth rate
2. Project Trip generation - (the latest edition of the Institute of Transportation Engineers (ITE) Trip Generation Manual. Other sources require prior approval by the City.
3. Project Trip distribution and assignment figures
4. Other factors affecting trip generation (identify any factors used to adjust trip generation, such as pass-by trips, internal trips, or modal choice. Use of any trip reduction factors require prior approval by the City and should be based on accepted traffic engineering documentation such as trip generation manual
5. Project peak hour turning movement traffic
6. Project daily volumes on roadway links, if required
7. Project completion or phase completion traffic volumes

D. Cumulative Traffic (background)

1. Ambient growth rate
2. Identify location of other approved or proposed development projects and provide figure
3. Trip generation table for other approved projects
4. Trip assignment figure of other approved development projects
5. Total background peak hour turning movement volumes

IV. Traffic Analysis

A. Capacity and Level of Service and Improvement Analysis

1. Delay and Level of Service for existing traffic conditions without project, with existing improvements
2. Delay and Level of Service at study years with project, with existing and committed improvements (funded for construction)
3. Delay and Level of Service at study years with additional improvements (if required to achieve the General Plan required Level of Service)
4. Delay and Level of service under Cumulative conditions, with existing and committed improvements (funded for construction) and without and with additional improvements

V. Findings and Recommendations

A. Traffic Impacts and Level of Service Analysis

1. Proposed measures to achieve LOS at impacted intersections. Identify if improvements are scheduled for construction, funded for future implementation by a regional mechanism, or not funded.

B. Traffic signal warrant analysis - indicate intersections found to meet signal warrants at study year and share of project traffic contribution (use peak hour for existing intersections and daily for new intersections).

C. Circulation recommendations

1. On-site
2. Area wide - provide exhibit showing roadway improvements and signal locations
3. Phasing (if appropriate)

E. Safety and operational improvements

F. Specific Plan signalization analysis (for Specific Plans only)

G. General Plan Conformance (for Specific Plans and General plan amendments only)

H. Identify existing or proposed Regional funding mechanisms

Exhibit E

Level of Service Standards

The City of Lake Elsinore, in general, requires that peak-hour intersections operate at LOS “D” or better to be considered acceptable. Therefore, any City intersection operating at LOS “E” or LOS “F” will be considered deficient. However, LOS “E” will be considered acceptable in both the Main Street Overlay area and the Ballpark District Planning Districts in an effort to increase activity and revitalize these areas. Any intersection operating at LOS “F” will be considered deficient.

Exhibit F

VMT Forecasting Information

Most trip-based models generate daily person trip-ends for each TAZ across various trip purposes (Home-Based Work (HBW), Home-Based Other (HBO), and Non-Home Based (NHB), for example) based on population, household, and employment variables. This may create challenges for complying with the VMT guidance because trip generation is not directly tied to specific land use categories. The following methodology addresses this particular challenge among others.

Production and attraction trip-ends are separately calculated for each zone, and, generally, production trip-ends are generated by residential land uses and attraction trip-ends are generated by non-residential land uses. OPR's guidance addresses residential, office, and retail land uses. Focusing on residential and office land uses, the first step to forecasting VMT requires translating the land use into model terms, the closest approximations are:

- Residential: home-based production trips
- Office: home-based work attraction trips

Note that this excludes all non-home-based trips including work-based other and other-based other trips.

The challenges with computing VMT for these two types of trips in a trip-based model are 1) production and attraction trip-ends are not distinguishable after the PA to OD conversion process and 2) trip purposes are not maintained after the mode choice step. For these reasons, it not possible to use the VMT results from the standard vehicle assignment (even using a select zone re-assignment). A separate post-process must be developed to re-estimate VMT for each zone that includes trip-end types and trip purposes. Two potential approaches to tackle this problem are described below.

1.0 Quick and Easy

This approach uses standard model output files and requires minimal custom calculations. It is based on a regional MPO trip-based model with peak (PK) and off-peak (OP) skims and person trip production-attraction (PA) matrices.

- Calculate custom vehicle trip PA matrices from PK and OP person trip matrices
 - Keep trip purposes and modes separate
 - Use average vehicle occupancy rates for drive-alone and shared ride trips
- Use the final congested drive-alone PK and OP skim matrices to estimate trip length between zones
- Multiply the skim matrices by vehicle trip matrices to estimate VMT
- Sum the PK and OP results to estimate daily VMT and aggregate mode trip purpose and mode
- Calculate automobile VMT for individual TAZs using marginal totals:
 - Residential (home-based) - row total
 - Office (home-based work) - column total

2.0 Detailed and Complicated

The quick and easy process described above simplifies the approach but does not account for different congestion patterns throughout the day (AM, MD, PM, and NT), the direction of travel (all productions are origins and all attractions are destinations), or the benefits of exclusive lanes (HOV or HOT lanes). This more detailed approach attempts to address these limitations and better estimate the VMT produced by the vehicle assignment model.

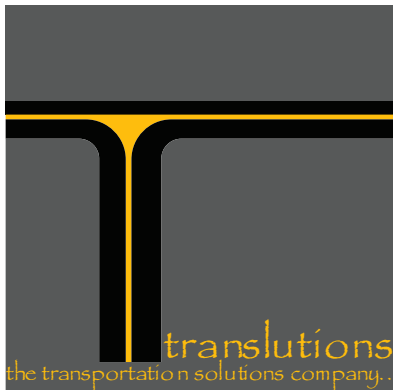

- Re-skim final loaded congested networks for each mode and time period
- Run a custom PA to OD process that replicates actual model steps, but:
 - Keeps departure and return trips separate
 - Keeps trip purpose and mode separate
 - Converts person trips to vehicle trips based on auto occupancy rates and isolates automobile trips
 - Factors vehicle trips into assignment time periods
- Multiply appropriate distance skim matrices by custom OD matrices to estimate VMT
- Sum matrices by time period, mode, and trip purpose to calculate daily automobile VMT
- Calculate automobile VMT for individual TAZs using marginal totals:
 - Residential (home-based) - row of departure matrix plus column of return matrix
 - Office (home-based work) - column of departure matrix plus row of return matrix

3.0 Appropriateness Checks

Regardless of which method is used, the number of vehicle trips from the custom PA to OD process and the total VMT should match as closely as possible with the results from the traditional model process. The estimated results should be checked against the results from a full model run to understand the degree of accuracy. Note that depending on how each model is setup, these custom processes may or may not include IX/XI trips, truck trips, or special generator trips (airport, seaport, stadium, etc.).

When calculating VMT for comparison at the study area, citywide, or regional geography, the same methodology that was used to estimate project-specific VMT should be used. The VMT for these comparisons can be easily calculated by aggregating the row or column totals for all zones that are within the desired geography.

Exhibit G

m e m o r a n d u m

DATE: November 18, 2021
TO: Nicholas Lowe, P.E., Consultant Traffic Engineer
FROM: Sandipan Bhattacharjee, P.E., T.E., AICP, ENV-SP
SUBJECT: Small Project Screening Criteria for Vehicle Miles Traveled

Translutions, Inc. (Translutions) is pleased to provide this memorandum discussing the background and potential screening thresholds for the California Environmental Quality Act (CEQA) under Senate Bill 743 (SB-743) for the City of Lake Elsinore, Riverside County, California.

BACKGROUND

Senate Bill 743 (Steinberg, 2013), which was codified in Public Resources Code section 21099, required changes to the guidelines for implementing CEQA (CEQA Guidelines) (Cal. Code Regs., Title 14, Div. 6, Ch. 3, § 15000 et seq.) regarding the analysis of transportation impacts. As one appellate court recently explained: “During the last 10 years, the Legislature has charted a course of long-term sustainability based on denser infill development, reduced reliance on individual vehicles and improved mass transit, all with the goal of reducing greenhouse gas emissions. Section 21099 is part of that strategy . . .” (Covina Residents for Responsible Development v. City of Covina (2018) 21 Cal.App.5th 712, 729.) ***Pursuant to Section 21099, the criteria for determining the significance of transportation impacts must “promote the reduction of greenhouse gas emissions,”*** the development of multimodal transportation networks, and a diversity of land uses.” (Id., subd. (b)(1); see generally, adopted CEQA Guidelines, § 15064.3, subd. (b) [Criteria for Analyzing Transportation Impacts].) To that end, in developing the criteria, OPR has proposed, and the California Natural Resources Agency (Agency) has certified and adopted, changes to the CEQA Guidelines that identify vehicle miles traveled (VMT) as the most appropriate metric to evaluate a project’s transportation impacts. With the California Natural Resources Agency’s certification and adoption of the changes to the CEQA Guidelines, automobile delay, as measured by “level of service” and other similar metrics, generally no longer constitutes a significant environmental effect under CEQA. (Pub. Resources Code, § 21099, subd. (b)(3).)

It should be noted that SB 743 (the legislation) does not specify any screening thresholds or impact criteria for transportation impacts using VMT. In fact, the legislation does not even specify VMT as the metric – but directs the OPR to identify the appropriate metric. The OPR evaluated several metrics including VMT, Automobile Trips Generated, Multimodal LOS, Fuel Use, and Motor Vehicle Hours Traveled, and ultimately settled on VMT. SB 743 includes legislative intent to help guide the development of the new criteria for transportation impacts to align with Green House Gas (GHG) reduction. For example, Section 1 of the legislation states: “*New methodologies under the California Environmental Quality Act are needed for evaluating transportation impacts that are better able to promote **the state’s goals of reducing greenhouse gas emissions and traffic-related air pollution**, promoting the development of a multimodal transportation system, and providing clean, efficient access to destinations.*” Further, subdivision (b) of the new Section 21099 requires that the new criteria “*promote the **reduction of greenhouse gas emissions**, the development of multimodal transportation networks, and a diversity of land uses.*”

OPR'S TECHNICAL ADVISORY

To assist in the process, the OPR released several technical advisories. The technical advisory states that “...(it) is one in a series of advisories provided by the Governor’s Office of Planning and Research (OPR) as a service to professional planners, land use officials, and CEQA practitioners. OPR issues technical assistance on issues that broadly affect the practice of land use planning and the California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 et seq.). (Gov. Code, § 65040, subds. (g), (l), (m).) **The purpose of this document is to provide advice and recommendations, which agencies and other entities may use at their discretion. This document does not alter lead agency discretion in preparing environmental documents subject to CEQA. This document should not be construed as legal advice.**”

SCREENING THRESHOLDS RECOMMENDED BY OPR

Many agencies use “screening thresholds” to quickly identify when a project should be expected to cause a less-than-significant impact without conducting a detailed study. (See e.g., CEQA Guidelines, §§ 15063(c)(3)(C), 15128, and Appendix G.) As explained below, this technical advisory suggests that lead agencies may screen out VMT impacts using project size, maps, transit availability, and provision of affordable housing. The Technical Advisory recommends the following thresholds:

Screening Threshold for Small Projects. Many local agencies have developed screening thresholds to indicate when detailed analysis is needed. Absent substantial evidence indicating that a project would generate a potentially significant level of VMT, or inconsistency with a Sustainable Communities Strategy (SCS) or general plan, *projects that generate or attract fewer than 110 trips per day generally may be assumed to cause a less-than significant transportation impact.*

Analysis. To set this 110-trip threshold, the OPR uses a CEQA exemption for additions to existing structures of up to 10,000 square feet. The Technical Advisory states, “CEQA provides a categorical exemption for existing facilities, including additions to existing structures of up to 10,000 square feet, so long as the project is in an area where public infrastructure is available to allow for maximum planned development and the project is not in an environmentally sensitive area. (CEQA Guidelines, § 15301, subd. (e)(2).) Typical project types for which trip generation increases relatively linearly with building footprint (i.e., general office building, single tenant office building, office park, and business park) generate or attract an additional 110-124 trips per 10,000 square feet. Therefore, absent substantial evidence otherwise, it is reasonable to conclude that the addition of 110 or fewer trips could be considered not to lead to a significant impact”. It should be noted that many land uses generate significantly higher trips than the 110 daily-trip threshold. For example, a 10,000 square foot Drive-In Bank generates 1,000 daily trips. Similarly, a 10,000 square foot drugstore with drive through window would generate 1,092 daily trips, and a USPS would generate 1,039 trips. **Therefore, there are many land-uses where the 10,000 square foot exemption would result in substantially higher trips than the 110-trip threshold used by the OPR.**

REVIEW OF SCREENING THRESHOLDS RECOMMENDED BY OTHER AGENCIES

Many agencies have adopted screening thresholds based on substantial evidence which are substantially higher than those recommended by the OPR. Several jurisdictions have adopted a threshold based on the appropriate GHG thresholds for the appropriate air quality management district. A few examples are listed below:

County of Riverside. The County of Riverside is using the 3,000 metric tons of Carbon Dioxide Equivalent (CO₂e) as the screening threshold. Based on the County’s thresholds, the following projects are considered to have a less than significant impacts under VMT:

- Single Family Housing projects less than or equal to 110 Dwelling Units; or
- Multi Family (low rise) Housing projects less than or equal to 147 Dwelling Units; or
- Multi Family (mid-rise) Housing projects less than or equal to 194 Dwelling Units; or
- General Office Building with area less than or equal to 165,000 SF; or

- Retail buildings with area less than or equal to 60,000 SF; or
- Warehouse (unrefrigerated) buildings with area less than or equal to 208,000 SF; or
- General Light Industrial buildings with area less than or equal to 179,000 SF
- Project GHG emissions less than 3,000 Metric Tons of Carbon Dioxide Equivalent (MTCO₂e) as determined by a methodology acceptable to the Transportation Department; or
- Unless specified above, project trip generation is less than 110 trips per day per the ITE Manual or other acceptable source determined by Riverside County.

City of Redlands. The City of Redlands is using the 3,000 metric tons of Carbon Dioxide Equivalent (CO₂e) as the screening threshold. Based on the County's thresholds, the following projects are considered to have a less than significant impacts under VMT:

- Single family residential – 167 Dwelling Units or fewer
- Multifamily residential (low-rise) – 232 Dwelling Units or fewer
- Multifamily residential (mid-rise) – 299 Dwelling Units or fewer
- Office – 59,100 square feet or less
- Retail – 112,400 square feet or less
- Warehousing – 463,600 square feet or less
- Light Industrial – 74,600 square feet or less

City of Victorville. The City of Victorville is also using the 3,000 metric tons of Carbon Dioxide Equivalent (CO₂e) as the screening threshold. Based on the County's thresholds, the following projects are considered to have a less than significant impacts under VMT:

- Single Family Residential – 136 Dwelling Units
- Multi-Family (Low Rise) Residential – 185 Dwelling Units
- Office – 227,000 square feet
- Retail – 122,000 square feet
- Warehousing – 829,000 square feet
- Light Industrial – 296,000 square feet

THRESHOLDS FOR LAKE ELSINORE

Methodology. Based on the intent and stated goals of SB-743, this analysis has evaluates land uses in the City from a GHG emissions perspective. The City of Lake Elsinore is located within the South Coast Air Quality Management District (SCAQMD). The SCAQMD in its *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans*¹ recommends a screening threshold of 3,000 MT of CO₂e per year for residential and commercial sectors and 10,000 MT of CO₂e per year for industrial projects. This analysis applies the 3,000 MT threshold to all uses. To conduct this evaluation, the following steps were takes:

¹ [http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-\(ghg\)-ceqa-significance-thresholds/ghgboardsynopsis.pdf?sfvrsn=2](http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgboardsynopsis.pdf?sfvrsn=2)

1. **Model Runs.** The new Riverside County Model (RIVCOM) was run for the base year of the model (2018). Average trip lengths for different trip types with origins or destinations in the City were identified. It should be noted that the RIVCOM lists internal and external trip lengths separately and for this analysis, the entire trips length was used. The model runs show the following average trip lengths:
 - Home-Based Work (HBW): Home-based work trips are trips that go between home and work and includes trips between home and work that include one or more intermediate stops, such as to drop-off or pick-up a passenger, to drop-off or pick-up a child at school, or for other reasons. The average HBW trip length for the City of Lake Elsinore was calculated at 26.3 miles.
 - Home-based school (HBSC): Home-Based School trips include all student trips with an at-home activity at one end of the trip and a Kindergarten through 12th grade school activity at the other end. This purpose does not include trips in the college/university category, which follows. The average HBSC trip length for the City of Lake Elsinore was calculated at 4.9 miles. It should be noted that this has not been used in the analysis as it is difficult to isolate school trips for GHG gas analyses.
 - Home-Based Other (HBO): Home-based other trips include all other home-based (with a home activity at one end of a trip) trips that are not work or school trips. The average HBO trip length for the City of Lake Elsinore was calculated at 8.1 miles.
 - Non-Home Based (NHB): Non-Home Based trips are trips that start and end at non-residential uses. The average NHB trip length for the City of Lake Elsinore was calculated at 7 miles.
2. **GHG Calculations.** The California Emissions Estimator Model (CalEEMod) was used to calculate GHG emissions based on the trip lengths identified above. For industrial and warehousing uses, an average truck trip length of 70 miles was used, which is a more conservative distance compared to the truck trip lengths calculated from the model. The default fleet mix from CalEEMod were used. The CalEEMod was run several times using an iterative process to calculate the number of units of land use (dwelling units, building area, etc.) which would result in GHG emissions of less than 3,000 metric tons of CO₂e). CalEEMod worksheets are included as an attachment.

Findings. Based on the CalEEMod worksheets, the following unit counts are anticipated to have less than significant impacts:

- Single Family – 148 Dwelling Units
- Multi Family Low Rise (Up to 2 levels) – 200 Dwelling Units
- Multi Family Mid Rise (between three and 10 levels) – 266 Dwelling Units
- General Office Building – 224,000 square feet
- Retail – 91,000 square feet
- Warehousing² (Unrefrigerated) – 258,000 square feet
- Light Industrial³ – 149,000 square feet
- Project GHG emissions less than 3,000 Metric Tons of Carbon Dioxide Equivalent (CO₂e) as determined by a methodology acceptable to the City. Use of project specific trip lengths from RIVCOM and resulting GHG data from CalEEMod runs are acceptable; or

² This was based on standard warehousing use in CalEEMod which uses a higher trip generation rate than High-Cube Transload And Short-term Storage Warehouse but uses a higher truck percentage, presenting a conservative analysis.

³ CalEEMod restricts light industrial uses to 50,000 square feet. This analysis is based on Heavy Industrial which is a more conservative approach due to a higher trip generation and higher truck trips associated with heavy industrial uses.

- Unless specified above, project trip generation is less than 110 trips per day per the ITE Manual or other acceptable source determined by the City.
